

STATION NETWORKS

DEGREANE HORIZON has been designing and building automated meteorological stations adapted to all climates since 1984.

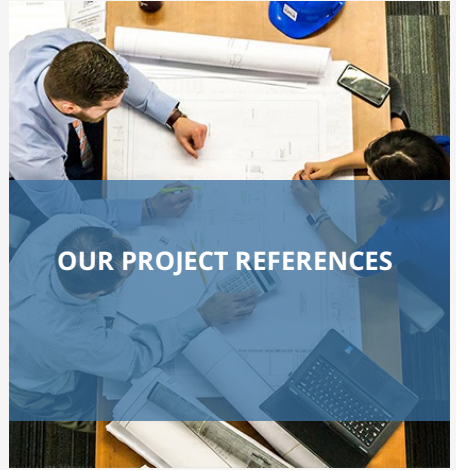

Network of climatological and synoptic Automatic Weather Stations

Over 1,500 stations have been deployed, sometimes at very remote sites, for the acquisition and processing of standard meteorological parameters (wind, temperature, humidity, precipitation, etc.) compliant with WMO and ICAO standards.

Meteorological data can be transmitted via various communication networks (cable, GSM, PSTN, etc.) operated either locally or by a remote-control centre.
